Asgn 2 A Small Numerical Library DESIGN.PDF

Pre Lab Questions

- 1. How do I do Taylor expansion without using preexisting math libraries?
 - a. When you see a sigma in math, think of a for loop. Use a for loop to imitate what taylor expansion is.
- 2. How does the code know when to stop doing taylor expansion?
 - a. Stop doing taylor expansion when your answer's decimal points are smaller than epsilon.
- 3. Do I need to compute powers manually?
 - a. Yes, You can not use the power function from math.h. Although, computing powers is simple; Use a for loop, starting from 1, and incrementing it by 1. Then multiply that to your base answer. Stop the loop when your incrementing reaches the power.
- 4. What's the formatting for the final printing
 - a. The return function should do all the printing in the code. The arcsin, arccos, arctan, and log functions only return an array of it's own data.
- 5. Can I call pi from <math.h>?
 - a. Yes, use M PI from <math.h>
- 6. When, Where and Can I use anything given in <math.h>?
 - a. When: Only in the print lines, and M PI for the arcos() function.
 - b. Where: Print lines, and arcos()
 - c. Yes you can use <math.h>. BUT, YOU CAN NOT use it to help compute your functions.

The main function should be able to seperate the army of return values and print them with the respective X, Library & Difference.

ex. Library arcSin Difference -1.0000 -1,57079633 -1.57079633 C. Occiler -0.9000O. alle -1.11976951 -1.11976951 -0.8000 O. elle -0.92729522 -0.92729522

- Calculate value until the deemal points are smaller than epsilon.

- Z = think of a for loop
- -01=1
- CAN NOT use <math.h > in created functions Lonly use math.h in print statements
